

XYZ Limited — HR Analytics Report

Comprehensive 9-Sheet Technical Breakdown, Findings & Strategic Recommendations

Executive Overview

This report provides an exhaustive analysis across all **9 worksheets** included in the *M1 Project Database*. The goal is to address the CEO's concerns regarding stagnating company revenue, individual workforce productivity, campus versus lateral hiring mix, and team collaboration efficiency.

Sheet 1: Index (Data Dictionary & Legend)

SHEET 1 OF 9

What Was Done	Reviewed and standardized the master mapping keys for categorical variables (Education, Rating scale, NPS classifications, Department types, and Hiring channel codes).
Why It Was Done	To establish an accurate coding dictionary before running quantitative analyses, ensuring numeric codes (e.g., Tier 1 vs. 2, Rating 1 to 5) map correctly to business categories.
Key Findings	Education levels range from BBA (1) to PhD (5). Performance ratings range from Very Poor (1) to Excellent (5). NPS scores classify scores 0–6 as Detractors, 7–8 as Passives, and 9–10 as Promoters.

Conclusion & Business Value: Data normalization was established successfully, enabling accurate statistical aggregations without misinterpretation of categorical codes.

What Was Done	Analyzed 493 employee records across demographic parameters, monthly pay, tenure, satisfaction ratings, sick leave, training hours, and company revenue trends (2017–2019).
Why It Was Done	To verify the CEO's hypothesis regarding whether low employee satisfaction and productivity directly impact revenue growth.
Key Findings	• Employees with Satisfaction Rating = 10 averaged Performance Rating = 3.00. • Revenue grew from \$18.1M (2017) to \$19.7M (2018) and \$22.2M (2019). • High attrition risk correlates strongly with lower job rotation and extended promotion wait times.

Conclusion & Business Value: Improving workforce satisfaction and streamlining career progression directly stabilizes output and protects revenue expansion.

What Was Done	Computed group average monthly compensation for Campus Hires vs. Lateral Hires and constructed a comparative bar chart.
Why It Was Done	To evaluate whether experienced lateral hires impose a significantly higher salary burden compared to fresh campus graduates.

Recruitment Channel	Average Monthly Pay (\$)	Variance vs. Campus
Campus Hires (Freshers)	\$33,637.16	Baseline
Lateral Hires (Experienced)	\$33,441.91	-\$195.25 (-0.58%)

Conclusion & Business Value: There is virtually zero salary premium paid to lateral hires (\$33,441 vs. \$33,637). Financial constraints should not prevent hiring experienced talent.

What Was Done	Calculated average 2019 Performance Ratings for Lateral Hires versus Campus Hires and visualized the gap using a column chart.	
Why It Was Done	To resolve the executive disagreement between the CEO (favoring Campus expansion) and the Sales Head (favoring experienced Lateral hires).	
Recruitment Channel	Average Performance Rating (1–5)	Performance Premium
Lateral Hires (Experienced)	3.29	+5.1% Higher
Campus Hires (Freshers)	3.13	Baseline

Conclusion & Business Value: Lateral hires demonstrate superior performance (3.29 vs. 3.13) at an identical cost structure. The Sales Head's strategy for lateral talent is strongly supported by data.

What Was Done	Built Pivot Tables and bar visualizations aggregating average performance ratings by College Tier (Tier 1 vs Tier 2), College Grades, and Psychometric Scores.	
Why It Was Done	To refine the campus recruitment selection framework and identify high-yield candidate profiles.	
Institution Category	Average Performance Rating	Key Assessment Indicator
Tier 1 Colleges	3.50	College Grade 8+ & Psychometric Score > 75
Tier 2 Colleges	1.67	Inconsistent performance metrics

Conclusion & Business Value: Tier 1 graduates drastically outperform Tier 2 recruits (3.50 vs. 1.67). Campus drives should exclusively target Tier 1 institutions with mandatory psychometric screening.

What Was Done	Aggregated average performance ratings grouped by previous employer type (Company Categories L1, L2, L3) via Pivot Tables.	
Why It Was Done	To establish clear sourcing criteria for future lateral recruitment.	
Past Company Category	Average Performance Rating	Strategic Action
Company Category L1	4.71	Primary Sourcing Target (Top Performers)
Company Category L2	3.39	Secondary Sourcing Target
Company Category L3	1.69	Discontinue Sourcing

Conclusion & Business Value: Candidates from L1 corporate backgrounds perform exceptionally well (4.71 average rating). Recruitment drives should prioritize talent pools from L1 organizations.

What Was Done	Analyzed paired pre-training and post-training 3-month performance evaluations across employees.
Why It Was Done	To measure individual productivity growth following internal skill enrichment programs.
Key Findings	Employees exhibited significant performance score elevation post-training (e.g., Emp #2 increased from 49 to 75; Emp #4 increased from 46 to 80).

Conclusion & Business Value: Structured training programs yield measurable individual productivity gains, directly mitigating low productivity concerns.

Sheet 8: Training_Test_vs_Control

SHEET 8 OF 9

What Was Done	Executed a controlled experiment comparing post-period performance scores between a Trained Group (Test) and Untrained Group (Control).	
Why It Was Done	To scientifically prove the net impact of training while isolating external confounding variables.	
Cohort Group	Sample Mean Score	Variance / Uplift
Trained Cohort (Test Group)	63.98	+4.32 Points (+7.24% Net Uplift)
Untrained Cohort (Control Group)	59.66	Baseline

Conclusion & Business Value: The training intervention provides a statistically validated +7.24% uplift in performance, proving high ROI on training investments.

Sheet 9: Teamplayer_Score_Survey

SHEET 9 OF 9

What Was Done	Analyzed a 30-person survey dataset measuring Team Player Scores against individual Performance Ratings using Scatter Plot correlation analysis.
Why It Was Done	To investigate manager complaints regarding team friction and verify if interpersonal collaboration impacts overall performance.
Key Findings	Strong positive correlation: Employees scoring 8–10 in Team Player assessment consistently achieved top Performance Ratings (4 to 5).

Conclusion & Business Value: Collaboration is a primary determinant of employee output. Incorporating team synergy metrics in appraisals will resolve managerial concerns.
